About This Guide

This document provides a concise, action-oriented guide for deploying **Health BRIDGE DataCare** with **Amazon S3** as the cloud storage target.

This guide helps you:

- Deploy Health BRIDGE and DataCare
- Connect medical data sources to Amazon S3
- Enable core data management capabilities
- Validate successful operation

This guide does not cover:

- Advanced policy tuning
- Configuration templates
- Deep troubleshooting

For advanced scenarios, refer to the **Health BRIDGE Administration Guide**. Request full document or ask for information [here](#).

Solution Overview

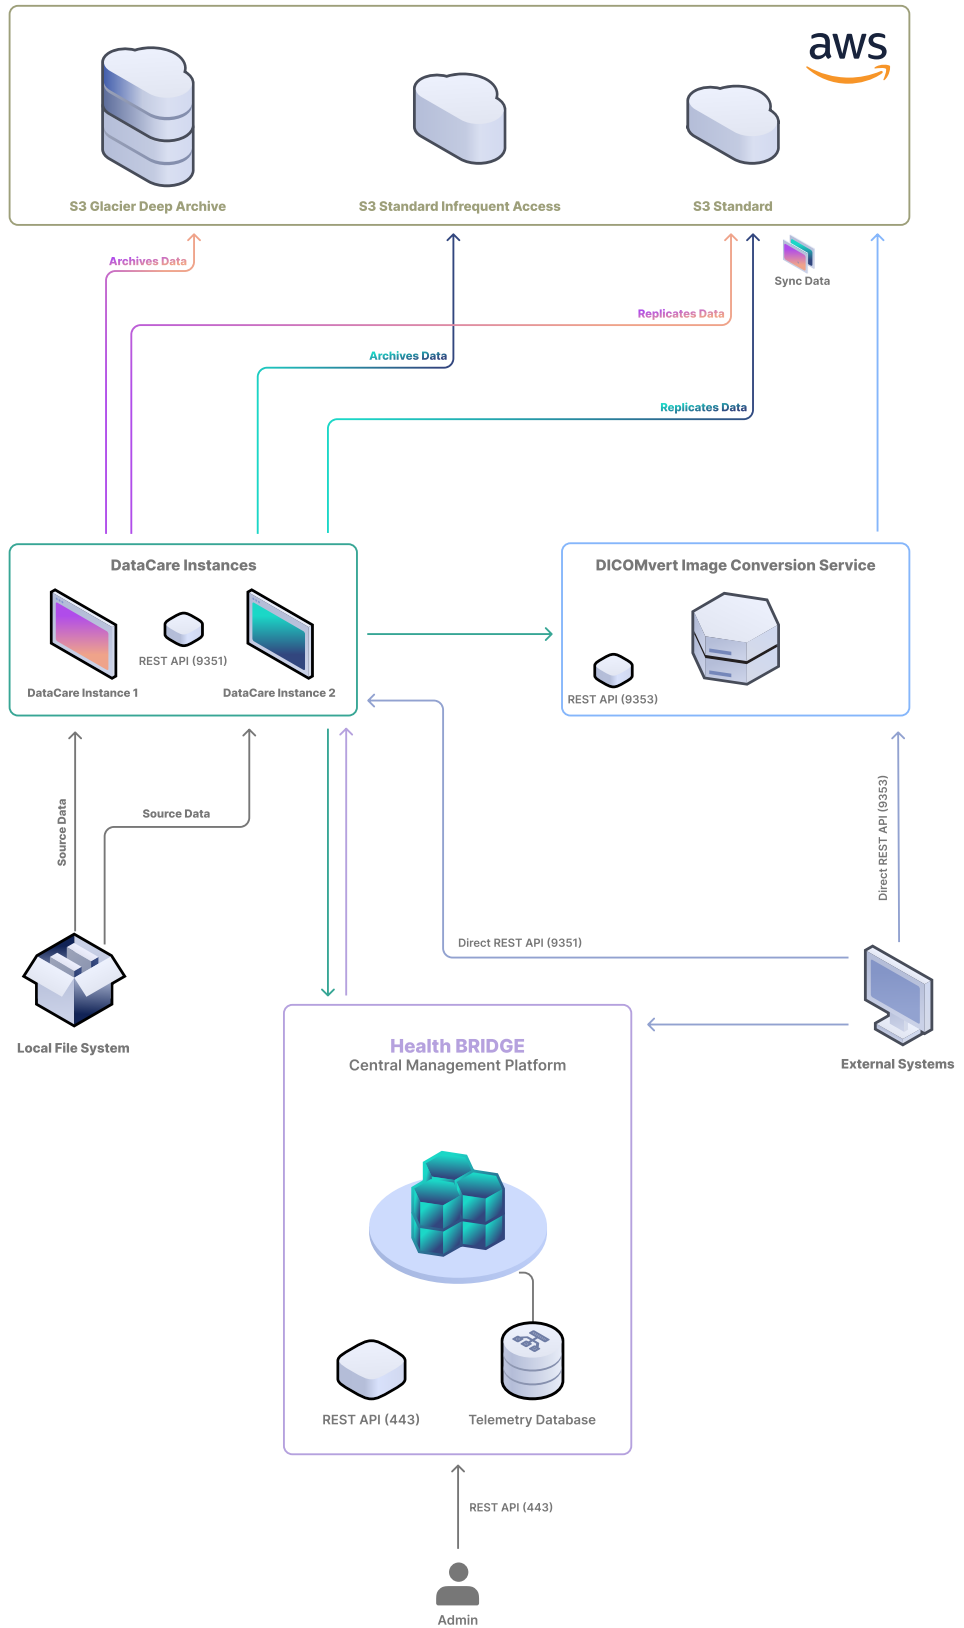

Health BRIDGE is a software platform for lifecycle management of your unstructured medical data to support cloud and AI adoption. Health BRIDGE ensures medical data is properly stored, intelligently tiered, and available at all times wherever you are.

The Health BRIDGE platform provides centralized management and monitoring of DataCare instances, computers running DataCare on the same network. After installing Health BRIDGE on the computer designated to manage the platform, you must add one or more DataCare instances to monitor their activity or manage the Tiger Health Technology software modules running on them.

DataCare links a source location on the computer to a cloud storage target, seamlessly managing data between them through the following automatic mechanisms:

- **Data Replication** - source data is copied to the target for backup purposes.
- **Space Reclaiming** - replicated files on the source are replaced with stub files, which appear identical to the original files for users and applications but do not consume space. The stub files retain a link to the replicas on the target, and when accessed, DataCare retrieves the original files from the target automatically.
- **Data Archiving** - replicated data is moved from frequently accessed tiers on the target to archival tiers for cost optimization.
- **Geo Synchronization** - synchronizes data across two or more sources, each on a different computer, through a common target.
- **Policies** ensuring against data loss on both the source and the target, allowing you to recover accidentally deleted data and keep versions of your files.

All administration, from activating the products to managing their configurations and monitoring all data, storage and processing activity, is performed through the Health BRIDGE web interface, which is accessible from any computer on the same network.

Supported Deployment Models

- On-premises DataCare connecting to Amazon S3
- Amazon EC2-hosted DataCare connecting to Amazon S3

High-Level Data Flow

1. Data is written to the source location
2. DataCare replicates data to Amazon S3
3. Optional lifecycle actions are applied (reclaiming, archiving)
4. Data is retrieved on demand when accessed

AWS Prerequisites

Before deployment, ensure the following AWS prerequisites are met.

AWS Account

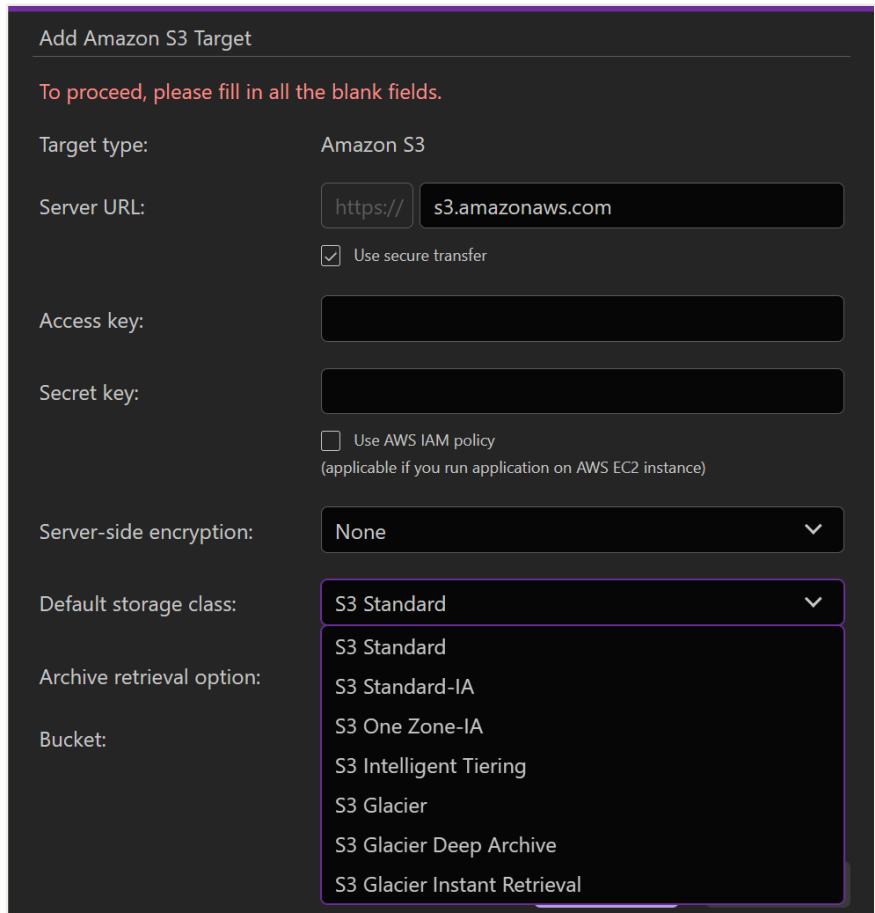

- Active AWS account
- Permission to create and manage Amazon S3 buckets
- Permission to create Identity and Access Management (IAM) users or roles

Amazon S3 Requirements

- One bucket per DataCare source
- Supported storage classes:
 - S3 Standard

- S3 Standard-IA
- S3 Glacier Flexible Retrieval
- S3 Glacier Deep Archive

And more...

Add Amazon S3 Target

To proceed, please fill in all the blank fields.

Target type: Amazon S3

Server URL:

Use secure transfer

Access key:

Secret key:

Use AWS IAM policy
(applicable if you run application on AWS EC2 instance)

Server-side encryption:

Default storage class:

Archive retrieval option:

Bucket:

- Optional S3 Transfer Acceleration

Network Connectivity

- HTTPS (TCP 443) access to Amazon S3 endpoints
- Stable, low-latency connectivity recommended

Security and IAM

Data Protection Model

- Data encrypted in transit using SSL/TLS
- Data encrypted at rest using Amazon S3 server-side encryption
- Credentials stored locally using AES-256 encryption

IAM Authentication Options

- IAM user with access keys
- IAM role attached to EC2 instance

Required S3 Permissions

- List bucket (optional)
- Read/write objects
- Manage object versions
- Manage lifecycle configuration

Use least-privilege policies whenever possible.

System Preparation

Health BRIDGE Requirements

- Windows 10 / Windows Server 2016 or later
- Minimum 2 CPU cores (4 recommended for multiple instances)
- Minimum 4 GB RAM
- 20 GB of available hard disk space
- 100 Mbit network connection
- TCP ports: 443, 9351

DataCare Requirements

- Windows 10 / Windows Server 2016 or later
- Minimum 2 CPU cores (4+ recommended)
- Minimum 4 GB RAM
- 2 GB of available hard disk space
- TCP ports: 80, 443, 8537, 9351, 9355
- Microsoft .NET Framework 4.8

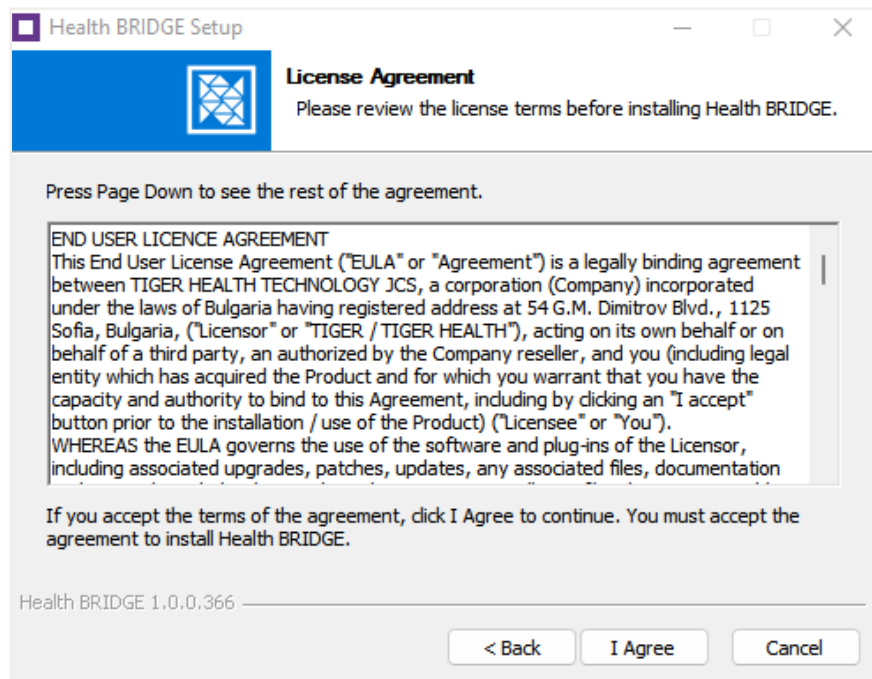

Digital Certificates

- Required GlobalSign and DigiCert root certificates installed

Install the Software

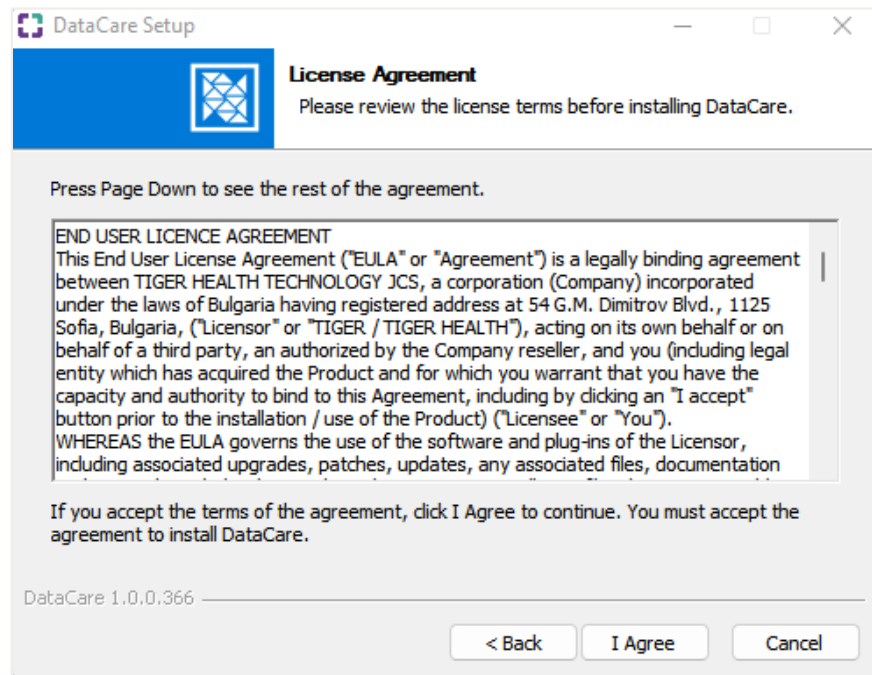

Install Health BRIDGE

1. Run the Health BRIDGE installer
2. Accept the license agreement
3. Complete installation

Install DataCare

1. Run the DataCare installer on each DataCare computer
2. Accept the license agreement
3. Restart the system after installation

Verify Services

- Confirm DataCare service is running
- Confirm Health BRIDGE web interface is accessible

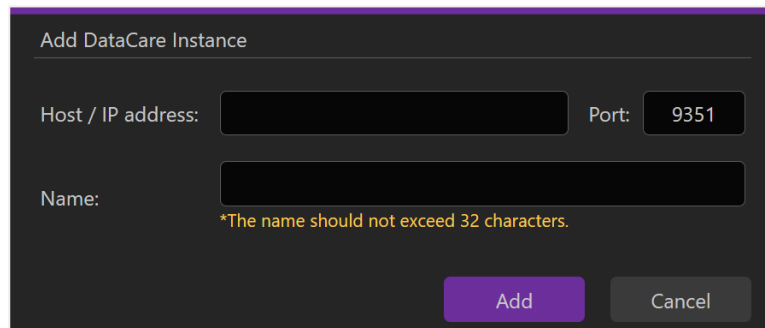

Initial Setup

Access the Web Interface

- Open a browser and connect via HTTPS to the Health BRIDGE server

Add DataCare Instances

1. Open **Settings > Configuration**
2. Select **Add DataCare**
3. Enter hostname / IP address and name

The screenshot shows a dark-themed dialog box titled "Add DataCare Instance". It contains two input fields: "Host / IP address:" and "Name:". The "Host / IP address:" field is followed by a "Port:" label and a text box containing "9351". Below the "Name:" field, there is a yellow asterisk warning: "*The name should not exceed 32 characters." At the bottom right, there are two buttons: "Add" (highlighted in purple) and "Cancel" (greyed out).

Activate DataCare

- Activate using SaaS credentials or offline activation key

Activate DataCare License

SaaS Offline

Username:

Password:

Activate DataCare License

SaaS Offline

Serial key: FSFPG-GNHJM-RTJEN-R351G-1QWR9 

You can obtain your activation key(s) here.

Activation keys:

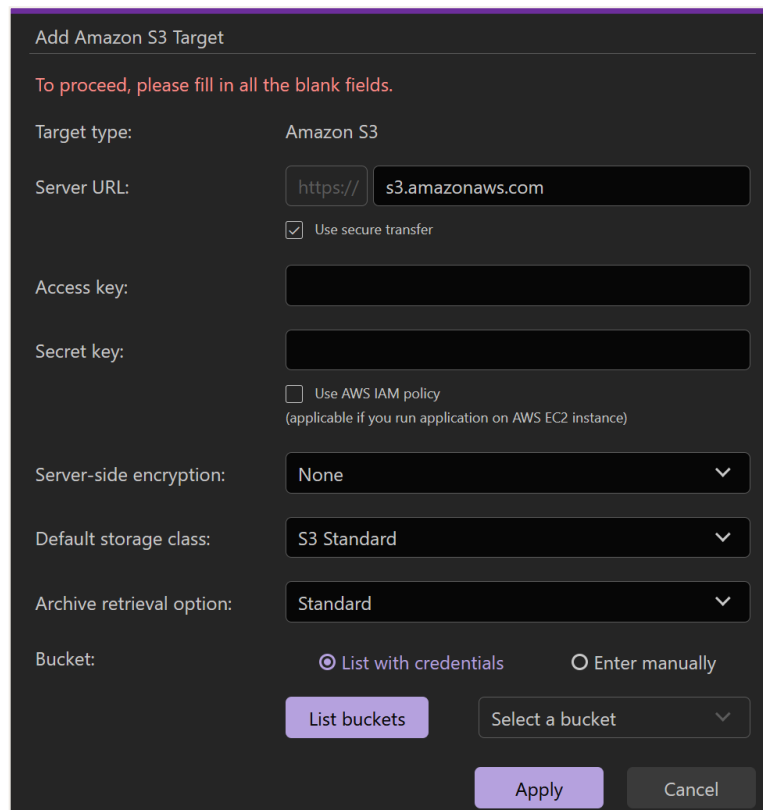

Connect Data to Amazon S3

Select Source Type

- Local NTFS/ReFS volume or folder
- NAS (SMB) share

Configure Amazon S3 Target

The screenshot shows a configuration window titled "Add Amazon S3 Target". At the top, it says "To proceed, please fill in all the blank fields." The "Target type" is set to "Amazon S3". The "Server URL" field contains "https://" and "s3.amazonaws.com". There is a checked checkbox for "Use secure transfer". The "Access key" and "Secret key" fields are empty. There is an unchecked checkbox for "Use AWS IAM policy" with a note "(applicable if you run application on AWS EC2 instance)". The "Server-side encryption" dropdown is set to "None". The "Default storage class" dropdown is set to "S3 Standard". The "Archive retrieval option" dropdown is set to "Standard". The "Bucket" section has two radio buttons: "List with credentials" (selected) and "Enter manually". Below these are a "List buckets" button and a "Select a bucket" dropdown. At the bottom are "Apply" and "Cancel" buttons.

- Specify S3 endpoint
- Enter credentials or select IAM policy
- Choose default storage class

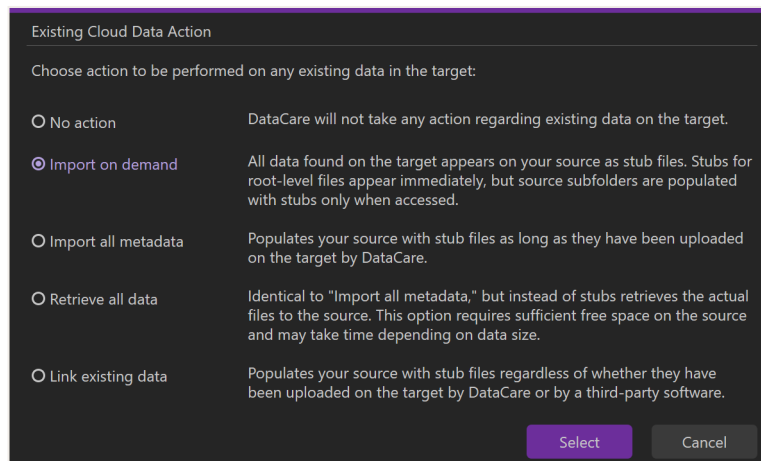

- Archive retrieval option
- Server-side encryption
- Secure transfer is enabled by default; could be disabled
- Enter a bucket

If the user whose credentials you have provided, does not have sufficient permissions to list all buckets, the Health BRIDGE platform provides you with the option to enter the bucket name manually.

Select a separate bucket for each source configured on the same computer.

Handle Existing Data

In the following dialog, select what to do with data already existing in the bucket:

Existing Cloud Data Action

Choose action to be performed on any existing data in the target:

- No action
DataCare will not take any action regarding existing data on the target.
- Import on demand
All data found on the target appears on your source as stub files. Stubs for root-level files appear immediately, but source subfolders are populated with stubs only when accessed.
- Import all metadata
Populates your source with stub files as long as they have been uploaded on the target by DataCare.
- Retrieve all data
Identical to "Import all metadata," but instead of stubs retrieves the actual files to the source. This option requires sufficient free space on the source and may take time depending on data size.
- Link existing data
Populates your source with stub files regardless of whether they have been uploaded on the target by DataCare or by a third-party software.

Select Cancel

Validate Pairing

- Confirm source–target pair appears active
- Confirm initial replication starts

Enable Data Management

Enable Replication

- Replication is required for all deployments

Optional Space Reclaiming

- Replace replicated files with stubs to free local storage

Optional Archiving

- Move “old” data to Amazon S3 archive tiers

Enable Versioning

- Enable S3 bucket versioning
- Enable DataCare versioning policy

Validate and Monitor

Validate Data Movement

- Confirm files replicate to S3
- Confirm stub file behavior (if enabled)

Monitor Activity

- View various data movement metrics

- Monitor storage usage and throughput

Operational Notes

Cost Considerations

- Archive tiers reduce long-term storage costs
- Retrieval from archive tiers may incur delays and fees

Performance Notes

- Increase CPU cores for high-throughput workloads
- Use parallel replication threads carefully

Common Pitfalls

- Insufficient IAM permissions
- Bucket versioning not enabled
- Firewall ports blocked

Next Steps

- Configure advanced DataCare policies
- Enable synchronization across multiple DataCare nodes
- Review the Health BRIDGE Administration Guide for full configuration options
- Contact Tiger Health Technology support for complex scenarios [here](#)

About Tiger Health Technology

Tiger Health Technology, a spin-off of **Tiger Technology**, builds on the success of another venture from the same parent company, **Tiger Surveillance**, which has achieved global adoption and triple-digit growth in the field of video surveillance data management.

Tiger Health Technology is applying this proven expertise to the healthcare sector, where demand for advanced, mission-critical data storage solutions is rapidly growing. This trend presents a strong market opportunity for the company and its partners.

About Health BRIDGE & DataCare

Health BRIDGE is Tiger Health Technology's platform for lifecycle management of unstructured medical data, enabling cloud and AI adoption in digital pathology and healthcare.

Health BRIDGE is a software-only solution that integrates at the file system and/or network share level. It distributes data between the file system and cloud tiers based on user-defined policies and access patterns while preserving its native, non-proprietary format to ensure transparent access. Access to Health BRIDGE platform is facilitated through a secure (https) connection.

Health BRIDGE is a centralized management platform for **DataCare** instances operating within your environment. DataCare connects on-premises or cloud-based storage sources to Amazon S3 and manages the data lifecycle transparently.
