

# Tiger BRIDGE

## Tiger Bridge 4.1.3 Release Notes

*Fixes in Tiger Bridge 4.1.3 . . . . . 2*

*Upgrading to Tiger Bridge 4.1.3 . . . . . 2*

*Unresolved Known Issues . . . . . 2*

This document provides release information for Tiger Bridge version 4.1.3. It fixed and unresolved known issues in this release.

## **Fixes in Tiger Bridge 4.1.3**

### **Connecting to Amazon S3 Target Without Entering Region Specific URL**

With version 4.1.3 there's no need to enter a region specific URL when pairing a source with a bucket on the S3 target.

### **Retrieving Files to NetApp NAS Source**

Version 4.1.3 resolves a problem, which could prevent the retrieval of replicated data on a NetApp NAS source.

## **Upgrading to Tiger Bridge 4.1.3**

To upgrade Tiger Bridge to this new version, you should simply run the installation of version 4.1.3 on the computer running Tiger Bridge. All configuration settings will be preserved after the upgrade.

## **Unresolved Known Issues**

### **Retrieving Offline Files from Google Cloud**

Unlike other cloud targets, offline files stored on a Google Cloud target are directly retrieved on the source when you attempt to open them or to manually rehydrate them.

### **Using Versioning Software on Azure Append/Page Blob**

When using versioning on Microsoft Azure append or page blob as a target, you should keep in mind that the first version of each file is not kept and the second version overwrites it. From the second version onwards versioning works as expected on Azure append and page blobs.

A workaround to the problem is to introduce an insignificant change to the file after it has been initially replicated on the Azure append/page blob (such as an added interval at the end of a text document, for example) in order to trigger versioning for that file from that change onwards.
